

digitalSTROM on Smartphones

Introducing the JSON API

Link to documentation:

<http://redmine.digitalstrom.org/projects/dss/wiki/Documentation>

Example: <https://10.0.0.2:8080/json/apartment/getConsumption>

Returns:

```
▼ {  
  "ok": true,  
  ▼ "result": {  
    "consumption": 0  
  }  
}
```

How a JSON request is buildt up:

`https://<server ip>:<port>/json/
<class>/<function>?<paramter>&<parameter>`

Applications outside the dSS should access through port 8080, using the token login system.

Login Process

First time

Request
application
token

<https://10.0.0.2:8080/json/system/requestApplicationToken?applicationName=testApp>

Notice port 8080. You CANNOT request an application token from a logged in session. This returns an application token.

Login with
user/pass

<https://10.0.0.2:8080/json/system/login?user=dssadmin&password=dssadmin>

This returns a temporary session token.

Enable
application
token

https://10.0.0.2:8080/json/system/enableToken?applicationToken=<the_application_token>&token=<the_temporary_session_token>

Use the temporary session token. The application token is now enabled.

Login Process

Subsequent times

Request
Session token

Perform JSON
request using
session token

<https://10.0.0.2:8080/json/system/loginApplication?loginToken=<the application token>>

This returns a session token.

A session token is valid for 60 seconds,
and gets renewed every time it is used.

<https://10.0.0.2:8080/json/apartment/getConsumption&token=<the session token>>

If the session token is valid, the consumption is returned.

Notes:

- The dSS uses a self signed certificate, so in order to connect the user should accept that the certificate is not signed by a known authority. This can also be solved by simply accepting any certificate in your network client.
- Store the application token in your application.
- Install a JSON plugin for your browser, and try out your JSON commands there first.
